## INTERNATIONAL PRELIMINARY **EXAMINATION REPORT**

International application No.

PCT/DK 03/00433

i.	Basis	of the	report
----	-------	--------	--------

1. With regard to the **elements** of the international application (Replacement sheets which have been furnished to the receiving Office in response to an invitation under Article 14 are referred to in this report as "originally filed" and are not annexed to this report since they do not contain amendments (Rules 70.16 and 70.17)):

	Doco	ription, Pages					
	1-14	ipuon, rages	as originally filed				
	1-14	•					
	Clain	ns, Numbers					
	1-10		received on 22.06.2004 with letter of 22.06.2004				
		vings, Sheets	as originally filed				
	1/4-4	-/4					
2.	With	regard to the languag	e, all the elements marked above were available or furnished to this Authority in the national application was filed, unless otherwise indicated under this item.				
	The	se elements were avail	able or furnished to this Authority in the following language: , which is:				
	T 110.	the learning of a trans	slation furnished for the purposes of the international search (under Rule 23.1(b)).				
	_		otion of the international application (under Rule 48.3(b)).

### Re Item V

Reasoned statement under Article 35(2) with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement

- Document US-A-5154 382 describes a rotatable link, comprising a pipe, two first 1. objects each having a bore, a second object having a bore, and an attachment means extending through said bores and, in said order, assembling the first object, the second object and a first object into a unit.
- Claim 1 differs therefrom in that the two first objects are secured to the pipe on a 2. part of the area of a rim of the pipe with contact to the two first objects, thereby providing a mechanical tension in the pipe which is transferred as compressive forces in the longitudinal direction of the attachment means to the second object, which forms a link part rotatable relative to the two first objects with an axis of rotation along the longitudinal axis of the attachment means.
- The above features are neither known from, nor rendered obvious in respect of 3. prior art so that claim 1 therefore meets the requirements of article 33(2) and 33(3) PCT.
- Claims 2 to 8 contain advantageous modifications of the inventive idea embodied 4. in claim 1 and also meet the requirements of articles 33(2) and 33 (3) PCT.
- Document US-A-5154 382 discloses a method of manufacturing a rotatable link, 5. comprising assembling a unit consisting of two first objects each having a bore, a second object having a bore, and an attachment means passed through said bores and, in said order, assembles the first object, the second object and the other first object.
- Claim 9 differs therefrom in that the method comprises securing the unit to a pipe 6. on a part of the area of a rim of the pipe with contact to the two first objects, thereby providing a mechanical tension in the pipe which is transferred as compressive forces in the longitudinal direction of the attachment means to the second object, which forms a link part rotatable relative to the two first objects with an axis of rotation along the longitudinal axis of the attachment means.
- The above features are neither known from, nor rendered obvious in respect of 7.

**EXAMINATION REPORT - SEPARATE SHEET** 

prior art so that claim 9 also meets the requirements of article 33(2) and 33(3) PCT.

Claim 10 contain advantageous modifications of the inventive idea embodied in 8. claim 9 and also meet the requirements of articles 33(2) and 33 (3) PCT.

### Additional observations

- The description is not in conformity with the claims as required by Rule 5.1(a)(iii) PCT.
- Contrary to the requirements of Rule 5.1(a)(ii) PCT, the relevant background art 2. disclosed in the document US-A-5154 382 is not mentioned in the description, nor is this document identified therein.

PCT/DK2003/000433

#### **PATENT CLAIMS**

1. A rotatable link (1), comprising a pipe (2), two first objects (3) each having a bore, a second object (4) having a bore, and an attachment means (5) extending through said bores and assembling, in said order, a first object (3), the second object (4) and a first object (3) into a unit (71), wherein the two first objects (3) are secured to the pipe (2) on a part of the area of a rim (6) for the pipe (2), thereby providing a mechanical tension in the pipe (2) which is transferred as compressive forces in the longitudinal direction of the attachment means (5) to the second object (4), which forms a link part rotatable relative to the two first objects with an axis of rotation along the longitudinal axis of the attachment means (5).

15

2. A rotatable link (1) according to claim 1, additionally comprising one or more pairs of apertured discs (8), wherein it applies to each pair of apertured discs (8) that the apertured discs (8) of a pair are disposed on their respective sides of the second object (4) between this and a first object (3) and with the attachment means (5) through the hole in the apertured discs (8).

20

15

5

10

- 3. A rotatable link (1) according to claim 2, wherein the number of pairs of apertured discs (8) is two or more, such as three or more, such as four or more.
- 25 4. A rotatable link (1) according to claims 2-3, wherein apertured discs (8) are made of a material selected from the following substances: plastics and metal, such as brass and steel.
- A rotatable upright (10), comprising a rotatable link (1) according to any 30 one of the preceding claims on which a plate (11) is secured on the rotatable link part.

5

15

- LEPLACED BY 6. A rotatable upright (10) according to claim 5, comprising a handle (12) secured to the plate (11).
  - 7. A rotatable upright (10) according to any one of claims 5-6, comprising a rod (13), said pipe (2) being mounted down along said rod, with the longitudinal direction of the pipe (2) being essentially in parallel with the longitudinal direction of the rod (13).
  - 8. Use of a rotatable upright (10) according to any one of claims 5-7 for the positioning thereon of an object (14), such as a piece of hardware. 10
    - 9. A method of manufacturing a rotatable link (1), comprising the steps of:
    - assembling a unit (71) consisting of two first objects (3) each having a bore, a second object (4) having a bore, and an attachment means (5) in that the attachment means (5) is passed through said bores and, in said order, assembles a first object (3), the second object (4) and a first object (3),
  - securing the unit (71) to a pipe on a part of the area of a rim (6) of the pipe 20 with contact to the two first objects (3).
  - 10. A method according to claim 9, wherein one or more pairs of apertured discs (8) are moreover incorporated in the unit, and wherein it applies to each pair of apertured discs (8) that the apertured discs (8) of a pair are 25 disposed on their respective sides of the second object (4) between this and a first object (3) and with the attachment means (5) through the hole in the apertured discs (8).
